polarities play an important role in determining the structure of proteins. Using the electronegativity values in Figure $\backslash(\backslash\text{PageIndex}\{1\}\backslash)$, arrange the following covalent bonds—all commonly found in amino acids—in order of increasing polarity. Then designate the positive and negative atoms using the symbols $\delta+$ and $\delta-$:

The polarity of a bond—the extent to which it is polar—is determined largely by the relative electronegativities of the bonded atoms. Electronegativity (?) was defined as the ability of an atom in a molecule or an ion to attract electrons to itself. Thus there is a direct correlation between electronegativity and bond polarity.
