Statics is a branch in mechanics that studies the analysis of loads on particles in static equilibrium. To put this in simple terms, statics is the study of forces on something that is not moving. The most helpful method to solving statics problems is making sure the sum of the forces equal zero.

If the problem is not solved directly from the physics, then, • use the method of joints to solve for the unknowns if they are near a known force that can be used in the solution. • use the method of sections to solve for the unknowns if they are not near a known force that can be used in the solution.

In this practice problem, the vectors are rigged so that the alternate solution is easier than the default solution. The graphical method for addition of vectors requires placing them head to tail. The sum would be the resultant vector connecting the tail of the first vector to the head of the last.

I didn't do as well on the last statics test as I'd have liked. I really want to work through some problems and make sure that I'm doing them right (Because I'm obviously not) but I can't find any good solutions. We're working out of the Hibbeler 13th edition statics book (just for reference of the content).
