Why we all deserve a life worth living and a death worth dying for 'Most men don't fear death. They fear those things – the knife, the shipwreck, the illness, the bomb – which precede, by microseconds if you're lucky, and many years if you're not, the moment of death.' When Terry Pratchett was diagnosed with Alzheimer's in his fifties he was angry - not with death but with the disease that would take him there, and with the suffering disease can cause when we are not allowed to put an end to it. In this essay, broadcast to millions as the BBC Richard Dimbleby Lecture 2010 and previously only available as part of A Slip of the Keyboard, he argues for our right to choose - our right to a good life, and a good death too.

The following stories are based on the author's experiences working with Alzheimer's patients and reflect the resilience he saw on a daily basis. Joe Guse is a former comedian from Chicago who now works with and cares for the elderly while pursuing a career in clinical psychology. These stories reflect Joe's passion and caring, and are all based on people he met while working as an entertainer in a variety of Nursing homes.

Alzheimer's disease (AD) is an age-related neurological disease that affects tens of millions of people, in addition to their carers. Hallmark features of AD include plaques composed of amyloid beta, as well as neurofibrillary tangles of tau protein. However, despite more than a century of study, the cause of Alzheimer's disease remains unresolved. The roles of amyloid beta and tau are being questioned and other causes of AD are now under consideration. The contributions of researchers, model organisms, and various hypotheses will be examined in this Special Issue.

Far from celebrity media spotlight, ordinary individuals, many older and less advantaged, suffer the disabling pain of Parkinson's disease (PD), an illness whose progressive symptoms often mimic old age and cause mobility impairment, communication barriers, and social isolation. At the heart of With Shaking Hands is the account of elder Americans in rural Iowa who have been diagnosed with PD. With a focus on the impact of chronic illness on an aging population, Samantha Solimeo combines clear and accessible prose with qualitative and quantitative research to demonstrate how PD accelerates, mediates, and obscures patterns of aging. She explores how ideas of what to expect in older age influence and direct interpretations of one's body. This sensitive and groundbreaking work unites theories of disease with modern conceptions of the body in biological and social terms. PD, like other chronic disorders, presents a special case of embodiment which challenge our thinking about how such diseases should be researched and how they are experienced.

Recent advances in genetics and brain biochemistry point to the Abeta peptide as the major culprit in causing neurodegeneration in Alzheimer's Disease (AD). This book summarizes current knowledge of the Abeta peptide and its role in AD. Written by specialists in this fast moving area, the book covers fundamental biochemical studies on this peptide, the genetic impact on Abeta expression and processing, and various AD therapeutic strategies that target Abeta.

Alzheimer's disease is the most prevalent form of dementia. Although it was discovered about a century ago, the first drugs applied in treatment were only introduced in therapy in the last 30 years. This book focuses on the clinical pharmacology of drugs that aim to delay the progression of Alzheimer's disease, such as anticholinesterases and glutamate receptor antagonists, as well as treatment for the behavioral changes caused by the progression of the disease: antidepressants, antipsychotics, anxiolytics, and mood stabilizers. In addition, it describes important information about the pathophysiology and diagnostic methods of Alzheimer's disease, emergency situations conditioned by the dementia process, and presents new perspectives for the treatment of Alzheimer's disease. The ten chapters cover topics such as mechanism of action, dosage regimen, adverse reactions, drug interactions, toxicity profiles, among other information of clinical relevance. The work comprises evidence-based studies, providing a valuable resource for analyzing, prescribing and monitoring patients being treated for Alzheimer's disease. Written by experts with solid professional experience, this book will appeal to pharmacologists, geriatricians, neurologists, psychiatrists, biomedical clinicians, and other healthcare professionals.

This book discusses the latest research into the highly prevalent neurodevelopmental disease most commonly associated with aging: Alzheimer's disease (AD). Even after years of research, Alzheimer's disease is still far from being cured. It presents a range of common symptoms in the form of behavioral and cognitive impairments. This book describes the symptoms and the biology behind them. The contents covers latest findings on the genetics involved and various factors and pathways influencing disease development. It also covers various non-pharmacological therapies like immunotherapy, use of natural products, and employing nanotechnology in both the detection and treatment of AD. This book also highlights the role of diet and nutrition in healthy aging. Given its scope, it offers a valuable asset for researchers and clinicians alike.

Drug Design and Discovery in Alzheimer's Disease includes expert reviews of recent developments in Alzheimer's disease (AD) and neurodegenerative disease research. Originally published by Bentham as Frontiers in Drug Design and Discovery, Volume 6 and now distributed by Elsevier, this compilation of the sixteen articles, written by leading global researchers, focuses on key developments in the understanding of the disease at molecular levels, identification and validation of molecular targets, as well as innovative approaches towards drug discovery, development, and delivery. Beginning with an overview of AD pharmacotherapy and existing blockbuster drugs, the reviews cover the potential of both natural and synthetic small molecules; the role of cholinesterases in the on-set and progression of AD and their inhibition; the role of beta-site APP clearing enzyme-1 (BACE-1) in the production of  $\beta$ -amyloid proteins, one of the key reasons of the progression of AD; and other targets identified for AD drug discovery. Edited and written by leading experts in Alzheimer's disease (AD) and other neurodegenerative disease drug development Describes existing drugs for AD and current molecular understanding of the condition Reviews recent advances in the field, including coverage of cholinesterases, BACE-1, and other drug development targets

This text provides a broad survey of the role of insulin in the brain. And it discusses the mechanisms through which insulin dysregulation contributes to the development of cognitive impairment and late-life neurodegenerative disease.
